Abstract:

In this paper, we prove the existence of the fixed points for ciric's contractive condition combing with Berinde condition the class of so called ciric strong almost contraction in b-metric spaces. The ciric strong almost contraction appear to be one of the most general metrical condition for which the set of fixed points is not a singleton.

Our results extend and unify a multitude of fixed point theorems for multivalued maps.

Mathematics Subject Classifications (2000): 54H25, 47H10.

Keywords: fixed point, b-metric space, multivalued map

1-Introduction:

The concept of b-metric space was introduced by Czerwik((1998), since then several papers deal with fixed point theory for singlevalued and multivalued operators in b-metric see Singh et al.(2005),Boriceanu (2009) and Hashim (2011). Our purpose is to show that some well-known fixed point theorems are valid in b-metric spaces.

Let (X,d) be a metric space and CL(X) denotes the class of all nonempty

closed subset of X and CB(X) denotes the class of all nonempty closed bounded subset of X. For A,B,C we consider $d(x,B) = \inf \{d(x,y); y \in B\}$, the distance between x and B. For any $A,B \in CL(X)$, define a function $H:CL(X) \times CL(X) \rightarrow [0,\infty]$

$$H(A,B) = \max_{x \in A} \left\{ \sup_{x \in A} d(x,B), \sup_{y \in B} d(y,A) \right\},\,$$

then, H is said to be the generalize Housdorffmetric on CL(X) induced by the metric d, see for instance Czerwik S.

Theorem (1.1):Czerwik(1998)

Let (X,d) be a complete b-metric space. If $T: X \to CL(X)$, satisfies the inequality $H(Tx,Ty) \le \alpha d(x,y)$, $x,y \in X$, where $0 \le \alpha \le b^{-1}$, Then

(i) for every
$$x_o \in X$$
, there exist a sequence $\{x_n\} \subset X$ and $u \in X$ such that $x_{n+1} \in Tx_n$, $n = 0,1,2,3...$, and $\lim_{n \to \infty} x_n = u$,

(ii) the point u is a fixed point of T, i e $u \in Tu$.

Theorem (1.2): Berinde et al.(2007)

Let (X,d) be a complete metric space, $T: X \to CB(X)$ be a multivalued map and $L \ge 0$. Assume that $H(Tx,Ty) \le \alpha(d(x,y))d(x,y) + Ld(y,Tx)$, for all $x,y \in X$, where α is a function from $[0,\infty)$ into $[0,\infty)$ satisfying

 $\lim_{s \to t^+} \sup \alpha(s) < 1$ for all $t \in [0, \infty)$. Then $F(T) \neq \emptyset$ where F(T), the set of fixed point of T. As known, a mapping $\varphi: R_+ \to R_+$ is called a comparison function if it is increasing and $\varphi^n(t) \to 0, n \to \infty$, for any $t \in R_+$

Lemma (1.3):Rus(2001)

If $\varphi: R^+ \to R^+$ is a comparison function, then;

1) each iterate φ^k of φ , $k \ge 1$, is also a comparison function:

- 2) φ is continuous at zero;
- 3) $\varphi(t) < t$, for any t > 0.

Let $T: X \to CL(X)$ and consider the following condition for all $x, y \in X$:

1)
$$H(Tx,Ty) \le \alpha(d(x,y)) + Ld(y,Tx)$$
, where $L \ge 0$ and $0 < \alpha < 1$

2) $H(Tx,Ty) \le \alpha M(x,y)$,

where
$$M(x,y) = \left\{ d(x,y), d(x,Tx), d(y,Ty), \frac{1}{2} \left[d(x,Ty) + d(y,Tx) \right] \right\}$$

- 3) $H(Tx,Ty) \le \alpha M(x,y) + Ld(y,Tx),$
- 4) $H(Tx,Ty) \le \varphi M_1(x,y) + Ld(y,Tx).$

Where $M_1(x,y) = \{d(x,y), d(x,Tx), d(y,Ty), \frac{1}{2b}[d(x,Ty) + d(y,Tx)]\}$, where φ is

b-comparison function with $\varphi(z) = \frac{z}{b}$, $\varphi(0) = 0$, $b \ge 1$.

Remark (1.4):

Condition (1) is a very general contractive condition that allows the operator *T* to have more than one unique fixed point and it includes many contractive conditions from Rhoade's classification Rhoade(1977) and it is called a multivalued weak (almost)

contraction, see Berinde et al.(2007). Condition (1) and (2) are independents.

Condition (3) introduced by Berinde(2009) and by replacing the term $\alpha d(x,y)$ in (1) by $\varphi M_1(x,y)$ we get contractive condition (1). It is obvious that condition (4) is more general

contractive condition than (1) ,(2) and (3).

2. Preliminaries

Consistent with Hashim(2011) and Czerwik(1998) we use the following notations and definitions.

1)
$$d(x,y) = 0$$
 iff $x = y$,

2)
$$d(x,y) = d(x,y)$$
,

3)
$$d(x,z) \le b[d(x,y) + d(y,z)].$$

The pair (X,d) is called a b-metric space. We remark that a metric space is evidently a b-metric space. However, Czerwik [1] has shown a b-metric on X need not be a metric space on X.

Example (2.2):Czerwik(1998).

Let $X = \{x_1, x_2, x_3\}$ and $d: X \times X \to R^+$ such that $d(x_1, x_3) = a \ge 2$, $d(x_1, x_3) = d(x_2, x_3) = 1$ and $d(x_n, x_n) = 0$, $d(x_n, x_k) = d(x_k, x_n)$ for $n, k = 1, 2, 3, \ldots$. Then, $d(x_n, x_k) \le \frac{a}{2} [d(x_n, x_i) + d(x_i, x_k)]$, n, k, i = 1, 2, 3. Then (X, d) is a b-metric space. And if a > 2, the ordinary triangle inequality does not hold.

Definition (2.3):Boriceanu (2009)

Let (X,d) be a b-metric space. Then a sequence $\{x_n\}_{n\in\mathbb{N}}$ in X is called

Definition (2.1): Czerwik(1998).

Let X be a nonempty set and $b \ge 1$ a given real number. Afunction $d: X \times X \to R^+$ (nonnegative real numbers) is called a b-metric space provided that, for all $x, y, z \in X$,

The following example show b-metric on X not be a metric on X.

- a) Cauchy if and only if for every > 0 there exists $n(x) \in \mathbb{N}$ such that for each $n, m \ge n(x)$ we have $d(x_n, x_m) < x$.
- b) Convergent if and only if there exists $x \in X$ such that for all x > 0 there exists $n(x) \in \mathbb{N}$ such that for all $x \ge n(x)$ we have d(x, x) < x.
- c) The b-metric space is complete if every Cauchy sequence converges.

Lemma (2.4):Czerwik(1998).

For any $A, B, C \in CL(X)$.

- (i) $d(x,B) \le d(x,y)$, for any $y \in B$.
- (ii) $d(A,B) \leq H(A,B)$,
- (iii) $d(x,B) \le H(A,B)$, $x \in A$
- (iii) $H(A,C) \le s [H(A,B) + H(B,C)],$
- (iv) $d(x,A) \le sd(x,y) + sd(y,A), x,y \in X$.

Lemma (2.5)]Czerwik(1998).:

Let (X,d) be a b-metric space and $A,B \in CL(X)$. Then for each $\alpha > 0$ and for all $b \in B$ there exists $a \in A$ such that $d(a,b) \le H(A,B) + \alpha$.

Lemma (2.6): Singh et al. (2008).

Let (X,d) be a b-metric space and $\{y_n\}$ is a sequence in X such that $d(y_{n+1},y_{n+2}) \le qd(y_n,y_{n+1}), n = 0,1,2,...$

Then the sequence in X { y_n } is a Cauchy sequence in X, provided that sq < 1 where $q \in (0,1)$ and $s \ge 1$

Lemma 2.7: Pacurar(2010)

Any b-comparison function is a comparison function.

3. Main Results

Theorem (3.1):

Let (X,d) be a complete b-metric space with constant $b \ge 1$ and $T: X \to CL(X)$ a multivalued operator. Suppose that there exists a continuous $\varphi: R^+ \to R^+$ with $\varphi(z) = \frac{z}{b}$, $\varphi(0) = 0$, and for all $x, y \in X$. We have $H(Tx, Ty) \le \varphi M_1(x, y) + Ld(y, Tx)$, with strict inequality if $M_1(x, y) \ne 0$. Where

$$M_1(x,y) = Max \left\{ d(x,y), d(x,Tx), d(y,Ty), \frac{1}{2b} \left[d(x,Ty) + d(y,Tx) \right] \right\}$$
. Then T has a fixed point.

Proof:

Let $x_0 \in X$ and $x_1 \in Tx_0$. If $H(Tx_0, Tx_1) = 0$. Then, $Tx_0 = Tx_1$; that is $x_1 \in T_1$, which implies that $Fix(T) \neq \emptyset$.

Let $H(Tx_0, Tx_1) \neq 0$. Since $H(Tx_0, Tx_1) < \varphi(M_1(x_0, x_1) + Ld(x_1, Tx_1))$, by Lemma (2.5) we may choose $_{\circ} > 0$ with

$$H(Tx_0,Tx_1) + \mathcal{Q}(M_1(x_0,x_1)) + Ld(x_1,Tx_0) \leq \mathcal{Q}(M_1(x_0,x_1)),$$

Next we choose $x_2 \in Tx_1$ such that

$$d(x_{1},x_{2}) \leq H(Tx_{0},Tx_{1}) + \leq \varphi(M_{1}(x_{0},x_{1})) \leq \varphi \max\{d(x_{0},x_{1}), d(x_{0},Tx_{1}), \frac{1}{2b}[d(x_{0},Tx_{1}) + d(x_{1},Tx_{0})]\}$$

There is 4 cases,

1) If
$$M_1(x_0,x_1) = d(x_0,x_1)$$
. Then,

$$d\left(x_{1}, x_{2}\right) \leq \varphi d\left(x_{0}, x_{1}\right), \tag{3.1}$$

2) If $M_1(x_1,x_0) = d(x_0,Tx_0)$, then we have,

$$d\left(x_{1},x_{2}\right) \leq H\left(Tx_{0},Tx_{1}\right) + \sum \leq \varphi M\left(x_{0},x_{1}\right) + Ld\left(x_{1},Tx_{0}\right) \leq \varphi d\left(x_{0},x_{1}\right) < d\left(x_{0},x_{1}\right),$$

3) If $M_1(x_0,x_1)=d(x_1,Tx_1)$, then,

$$d(x_1,x_2) \le \varphi d(x_1,Tx_1) + Ld(x_1,Tx_0) \le \varphi d(x_1,Tx_1) < d(x_1,x_2),$$

4) If
$$M_1(x_0, x_1) = \frac{1}{2h} \left[d(x_0, Tx_1) + d(x_1, Tx_0) \right] = \frac{1}{2h} d(x_0, Tx_1)$$
, then,

$$d(x_1, x_2) \le \varphi\left[\frac{1}{2h}d(x_0, Tx_1)\right] < \frac{1}{2h}d(x_0, Tx_1) \le \frac{1}{2h}d(x_0, x_2) \le \frac{1}{2}[d(x_0, x_1) + d(x_1, x_2), d(x_0, x_1)] \le \frac{1}{2h}d(x_0, x_1) \le \frac{1}{2h}d(x_0,$$

Hence $d(x_1, x_2) < \frac{1}{2}d(x_0, x_1)$.

Thus (3.1)is true in all cases, $d(x_1, x_2) \le \varphi d(x_0, x_1) < d(x_0, x_1)$. Next we assume $M_1(x_1, x_2) \ne 0$ choose $\delta > 0$ with $H(Tx_1, Tx_2) + \delta \le \varphi(M_1(x_1, x_2) + Ld(x_2, Tx_1)$

Let $x_3 \in Tx_2$ such that, $d(x_2, x_3) \le H(Tx_1, Tx_2) + \delta \le \varphi(M_1(x_1, x_2))$.

If
$$M_1(x_2,x_3) = 0$$
, then $Fix(T) \neq \emptyset$

If $M_1(x_2, x_3) > 0$. Then, we will show that

$$d(x_2, x_3) \le \varphi(d(x_1, x_2)) \le \varphi^2 d(x_0, x_1), \tag{3.2}$$

Now if $M_1(x_1,x_2) = d(x_1,x_2)$, then (3.2) is true.

If $M_1(x_1,x_2)=d(x_1,Tx_1)$, then we have

 $d(x_2,x_3) \le \varphi d(x_1,Tx_1) + Ld(x_3,Tx_2) \le \varphi d(x_1,x_2)$, thus (3.2) is true.

If $M_1(x_1,x_2) = d(x_2,Tx_2)$, then

 $d(x_2,x_3) \le \varphi(d(x_2,Tx_2) < d(x_2,Tx_2) \le d(x_2,x_3)$, which is a contraction.

If $M_1(x_1, x_2) = \frac{1}{2b} d(x_1, Tx_2)$, then, we have

$$d\left(x_{2},x_{3}\right) \leq \varphi\left(\frac{1}{2b}d\left(x_{1},Tx_{2}\right)\right) < \frac{1}{2}d\left(x_{1},Tx_{2}\right) \leq \frac{1}{2b}d\left(x_{1},x_{3}\right) \leq \frac{1}{2}\left[d\left(x_{1},x_{2}\right) + d\left(x_{2},x_{3}\right)\right],$$

Thus $d(x_2, x_3) < d(x_1, x_2)$, which is a contraction. Thus (3.2) is true.

Hence in all cases (3.2) is true.

By an inductively procedure we will obtain $x_{n+1} \in Tx_n$, for n = 3, 4, ... with

$$d\left(x_{n+1},x_{n}\right) \leq \varphi M_{1}\left(x_{n-1},x_{n}\right),$$

The argument above guarantees that

$$d(x_n, x_{n+1}) \le \varphi(d(x_{n-1}, x_n) \le ... \le \varphi^n(d(x_0, x_1)).$$

Next we will prove that $\{x_n\}$ is a Cauchy sequence

$$d(x_n, x_{n+p}) \le bd(x_n, x_{n+1}) + b^2d(x_{n+1}, x_{n+2}) + \dots + b^pd(x_{n+p-1}, x_{n+p}),$$

$$d(x_{n},x_{n+p}) \leq b\varphi^{n}d(x_{0},x_{1}) + b^{2}\varphi^{n+1}d(x_{0},x_{1}) + \dots + b^{p}\varphi^{n+p-1}d(x_{0},x_{1}),$$

Which can also be written as

$$d\left(x_{n}, x_{n+p}\right) \leq \frac{1}{b^{n-1}} \left[b^{n} \varphi^{n} d\left(x_{0}, x_{1}\right) + b^{n+1} \varphi^{n+1} d\left(x_{0}, x_{1}\right) + b^{n+p-1} \varphi^{n+p-1} d\left(x_{0}, x_{1}\right) \right]$$

$$\leq \frac{1}{b^{n-1}} \sum_{j=n}^{\infty} b^{j} \varphi^{j} d\left(x_{0}, x_{1}\right) \rightarrow 0, \text{as } n \rightarrow \infty.$$

Thus $\{x_n\}$ is Cauchy sequence in the complete b-metric space (X,d). So there is $x^* \in X$ such that $x^* = \lim_{n \to \infty} x_n$.

In the following we prove that x^* is a fixed point of Ti.e. $x^* \in Tx^*$.

$$d(x^*, Tx^*) \le b[d(x^*, x_n) + d(x_n, Tx^*)] \le b[d(x^*, x_n) + H(Tx_{n-1}, Tx^*)] \le$$

$$d(x^*,Tx^*) \le b\varphi(\max\{0,0,d(x^*,Tx^*),\frac{1}{2b}(d(x^*,Tx^*))\} \le b\varphi d(x^*,Tx^*) < d(x^*,Tx^*),$$

Which implies that $d(x^*,Tx^*) = 0$, so that $x \in \overline{T}x = Tx$, (\overline{T}) is the closure of T).

Remark (3.2):

- (1) If L = 0 in condition then we obtain theorem (3.1) of Boriceanu(2009).
- (2) If $\varphi(z) = \alpha z$ in condition (4) then we obtain corollary(3.1) of Singh et al.(2008) with Y = X and f = I.
- (3) Theorem (3.1) generalize the main results of Pacurar (2010), Pacurar (2013) and Singh *et al.* (2012).
